

Brick Blend Buffing™

Concept / WIP

A field-care method for small-tag remediation, brick-tone blending, and visible neighborhood stewardship.

1) What it is

Brick Blend Buffing™ is a WallBuff field method for treating small tags and wall scars without turning a brick surface into a flat painted patch. The goal is not invisibility at two inches. The goal is a repaired wall that reads clean, cared for, and natural from the alley or sidewalk.

2) Why it matters

A fresh tag can become a signal that a wall is unclaimed. A blended repair sends a different signal: this boundary is watched, maintained, and worth respecting. Done carefully, the work preserves texture instead of escalating straight to abrasive cleaning, full repainting, or visual surrender.

field sequence: tag -> scar -> blend

3) Core loop

A small repair loop built around surface respect, tone control, and recurring boundary care.

4) Example model

- Small-tag remediation and brick-blend touchups
- Starter scope: tags, scars, garages, bins, and single-color painted walls
- Fair field pricing based on access, square footage, scar depth, and color complexity
- Optional photo log / field note for owners who want documentation

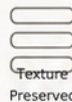

5) Best fit

- Brick walls where texture should remain alive
- Tags and small marks before they invite expansion
- Owners who want clean, cared-for boundaries without over-restoring
- Alleys, garages, side walls, and neighborhood-facing edges

6) Operating idea

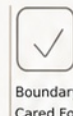

Public pressure signals and private stewardship can work together. Brick Blend Buffing™ treats graffiti response as boundary care: small, visible acts that reduce invitation, preserve surface character, and turn a nuisance into a craft signal.

Texture Preserved

Pressure Reduced
